**Publication Stage :**

(A) United States patent

**Abstract :**

A process and apparatus for the continuous manufacture of food products such as sausages is provided the need for intermediate stuffing of the food product into casings which are discarded prior to final pac preferred apparatus of the invention includes first and second heated rollers (16, 17) each presenting a p elongated, axially aligned channels or recesses (18,20) which are circumferentially and axially spaced o corresponding rollers (16, 17); in addition, the second roller (17) includes a series of elongated, continu

receiving openings (22) extending between each series of aligned recesses (20). Mechanisms (28, 29) are provided with the rollers (16, 17) in order to continuously feed elongated synthetic resin sheets (34, 35) into the rollers (16, 17). Rollers (24, 27) are provided for forcing portions of the sheets (34, 35) into the recessed openings (22) prior to passage of the sheets (34, 35) between the rollers (16, 17) where they are longitudinally sealed together to continuously form elongated, aligned food-receiving cavities (48). A plurality of feed tubes (11) extend through the rollers (16, 17) and are located within the corresponding openings (22) and recesses (20) to receive the rotation of the rollers (16, 17). The tubes (11) continuously direct the flowing food material into the cavities (48), the latter being transversely heat sealed via transverse sealing bars (60, 60') to form complete, enclosed food packages.
